

Power Whitening

For your dental health.

New breakthroughs in light-activated gels and high-intensity lights now make it possible to achieve a whiter, brighter smile — right here in our office.

A special gel protects your gums

Power whitening quickly brightens your smile

First, we thoroughly remove any plaque and tartar from your teeth. We then apply a whitening gel to your teeth, which is activated by a high-intensity light or laser. After each tooth has been treated, we rinse away the gel and repeat the cycle several times. To minimize the small amount of gum or tooth sensitivity you may experience for a few days following treatment, we may use a rubber dam or a special protective material applied directly to your gums.

The whitening agent is applied

Since every case is different, we carefully evaluate your individual results. We sometimes recommend additional bleaching at home or another session here in our office. Power whitening is an effective new technology that can help give you a beautiful new smile.

Great results in one appointment
