

## Dental Implants: The Most Natural Way to Replace Missing Teeth

Losing one or more teeth through decay, gum disease, or an accident can make it difficult for you to smile or chew food. Replace missing teeth and restore your smile with dental implants. Dental implants serve as roots for replacement teeth, securely fastening them to your jawbone for a firm yet comfortable fit.

Imagine a substitute for a missing tooth that fits so firmly and feels so comfortable, you could easily forget that it's not actually yours. Made of biocompatible titanium, dental implants are as close to natural teeth as you can get. Once your body fuses with the implants after they are placed into the bone, the replacement teeth are connected to the implants. Since the teeth are anchored into place by the implants, you won't have to worry about taking them out at night or bother with adhesive gels or glues to keep them in. Implants also reduce the risk of bone loss and receding gums. And because they provide all the stability and support your new teeth need, the surrounding teeth remain untouched.

Ask a DentalWorks affiliated dentist about implants as a long-lasting, long-term solution to missing teeth. To qualify for a dental implant, both you and your gums must be in excellent health; you will also need enough bone to support the implant.

This service is not offered at all DentalWorks affiliated practices. [Contact the affiliated practice](#) nearest you to learn how dental implants can bring back your smile and request an appointment today.
