## Post Op Crowns and Fillings

- Slight cold sensitivity is normal for a few days, if the sensitivity dose not resolve, please notify us.
- Soreness of the gums and injection site are normal. You can take Ibuprofen or Tylenol as needed for the discomfort.
- Be careful when you eat or drink when you are still numb, be especially careful not to chew or bite on your lips, tongue or cheeks. Be careful when drinking hot liquids not to burn yourself.
- When you become un-numb, the bite can feel off and a small adjustment to the filling or crown may be needed. This is very common and is a quick visit to insure the bite is correct.

All dental work causes trauma to the tooth and 5% of the time it can result in the tooth requiring a root canal.

**If you experience severe discomfort please notify the office as soon as possible.**
