

Should I get a Chemical Peel?

Have a peel now to exfoliate and refresh your skin

Why should you get a chemical peel during the winter? Chemical peels work best when you get a series of them. Because the weather is typically colder and gloomier, it gives you more time to stay out of the sun and let your face heal for seven to 10 days.

Ready to peel away the winter dryness? Restore your glow with a chemical peel. Because the winter weather is typically colder and dry due to less moisture in the air, skin becomes dehydrated and cracked. Chemical peels are designed to remove dry and damaged skin from your face. It enhances skin glow and radiance by inducing production of new collagen and stimulating new healthy skin cell growth.

To give a peel a try, call our Aesthetician, Patty at 215.361.3376

Hairloss

Alopecia is the medical term for hairloss. It can affect both men and women - and can have a number of causes ranging from genetics, to medicalions, autoimmune or due to health issues just to name a few. It can be sudden or gradual, localized or generalized, temporary or permanent and the patterns can vary between the sexes. It can involve any area of the body that grows hair - but most often we see patients who are losing hair on their head.

It can be challenging to determine the cause of hairloss and a thorough history and physical exam are needed to diagnose and devise a treatment plan. Lab testing can also be helpful.

There are many treatments that have been found to be beneficial in order to not only stop you from losing hair but also increase the likelihood that new hair can grow. Treatments are many and range from topical medications like Rogaline to oral medications like Propecia to name a few of the most well-known.

A new cutting edge treatment involving using the body's own natural healing and harnessing growth factors in the blood (known as Collagen Induction Therapy with Platelet-Rich-Plasma) has been gaining a lot of notoriety in the medical community and has been proven to reverse hair thinning and kick start the growth cycle of the hair. We offer this hair stimulation procedure in our office and have found it success in our patients.

In some patients certain vitamins and minerals may be lacking and thus influencing the hair to grow poorly or fall out prematurely. Supplementation with vitamins like vitamin D and biotin can assist the body in the process of making a better quality of hair. We believe in this so strongly that we have those supplements available for our patients to purchase right in our office!

So as you can see - not all is LOST for patients with hairloss!
